

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. **(Currently Amended)** Electric hand tool comprising, in a casing ~~[[2]]~~, electrically operated components and a housing ~~[[4]]~~ to accommodate a battery ~~[[3]]~~ that powers the said components, with detachable means ~~(10, 24)~~ of securing the battery in its housing in a position of mechanical locking and electrical connection to the said components and in a position in which it is mechanically retained in its housing but electrically disconnected, characterized in that the securing means ~~[[24]]~~ are designed to retain the battery ~~[[3]]~~ in the electrically disconnected position only by friction ~~(24, 31)~~.

2. **(Currently Amended)** Tool according to Claim 1, in which the battery-accommodating housing ~~[[4]]~~ is designed to accommodate therein a battery by sliding, and the battery securing means comprise an electrical locking finger ~~[[10]]~~ and a mechanical retaining finger ~~[[24]]~~ both mounted so that they can move, in a direction roughly orthogonal to the direction ~~[[39]]~~ in which the battery slides, between a locked and a retaining position, respectively, and a retracted function.

3. **(Currently Amended)** Tool according to Claim 2, in which the locking ~~[[10]]~~ and retaining ~~[[24]]~~ fingers are mounted so that they can be moved into the retracted position against the action of elastic return means ~~(16, 22)~~.

4. **(Currently Amended)** Tool according to ~~either of Claims 2 and 3~~ Claim 2, in which the locking finger ~~[[10]]~~ is secured to a rod ~~[[9]]~~ mounted to slide into the retracted position against the action of a return spring ~~[[16]]~~ under the action of an actuating trigger ~~[[11]]~~.

5. **(Currently Amended)** Tool according to ~~one of Claims 2 to 4~~ Claim 2, in which the retaining finger $[(24)]$ is secured to a pivoting elastic leaf $[(22)]$.

6. **(Currently Amended)** Tool according to ~~one of Claims 2 to 5~~ Claim 2, in which locking finger $[(10)]$ and the retaining finger $[(24)]$ are mounted to be moved into the retracted position, one in each of two opposite directions.

7. **(Currently Amended)** Battery for powering electrically operated components for the electric hand tool of the invention, characterized in that it comprises a mechanical and electrical locking catch $[(35)]$ and mechanical retaining ramp means ~~(31, 32)~~.

8. **(Currently Amended)** Battery according to Claim 7, in which the locking catch $[(35)]$ is formed by an undercut internal shoulder $[(36)]$.

9. **(Currently Amended)** Battery according to ~~either of Claims 7 and 8~~ Claim 7, in which the ramp means comprise a retaining boss $[(32)]$ with an entry ramp $[(28)]$ and an opposite retaining ramp $[(31)]$.

10. **(Currently Amended)** Battery according to Claim 9, in which the retaining boss $[(32)]$ is formed near the entry end $[(25)]$ of the battery $[(3)]$, via which end it is introduced into its accommodating housing $[(4)]$ in the tool, the locking catch $[(35)]$ and the retaining boss $[(32)]$ being formed respectively on two opposite sides ~~(26, 27)~~ of the battery.

11. **(new)** Electric hand tool comprising, in a casing, electrically operated components and a housing to accommodate a battery that powers the said components, with a detachable securing element for securing the battery in its housing in a position of mechanical locking and electrical connection to the said components and in a position in which it is

mechanically retained in its housing but electrically disconnected, characterized in that the securing element is designed to retain the battery in the electrically disconnected position only by friction.

12. (new) Tool according to Claim 11, in which the battery-accommodating housing is designed to accommodate therein a battery by sliding, and the battery securing element comprise an electrical locking finger and a mechanical retaining finger both mounted so that they can move, in a direction roughly orthogonal to the direction in which the battery slides, between a locked and a retaining position, respectively, and a retracted function.

13. (new) Tool according to Claim 12, in which the locking and retaining fingers are mounted so that they can be moved into the retracted position against the action of an elastic return element.

14. (new) Tool according to Claim 12, in which the locking finger is secured to a rod mounted to slide into the retracted position against the action of a return spring under the action of an actuating trigger.

15. (new) Tool according to Claim 12, in which the retaining finger is secured to a pivoting elastic leaf.

16. (new) Tool according to Claim 12, in which locking finger and the retaining finger are mounted to be moved into the retracted position, one in each of two opposite directions.

17. (new) Battery for powering electrically operated components for the electric hand tool of the invention, comprising a mechanical and electrical locking catch and a mechanical retaining ramp.

BEST AVAILABLE COPY

18. **(new)** Battery according to Claim 17, in which the locking catch is formed by an undercut internal shoulder.

19. **(new)** Battery according to Claim 17, in which the ramp comprises a retaining boss with an entry ramp and an opposite retaining ramp.

20. **(new)** Battery according to Claim 19, in which the retaining boss is formed near the entry end of the battery, via which end it is introduced into its accommodating housing in the tool, the locking catch and the retaining boss being formed respectively on two opposite sides of the battery of the battery.
